

Title: V Phone Product Review

Summary:

The V Phone, the mobile telephony offered by Matrix, is your best option in as far as flexible mobile VoIP service is concerned. The V Phone delivers a cost effective voice call and SMS service and allows users to designate their own VoIP setting. With the V Phone, users are not locked-in with pre-designated VoIP providers.

Body:

V Phone is your SIP client of VoIP software that you can download to your mobile handsets to enjoy the full benefits of a wide-range of best value services of mobile VoIP. This software is available to Symbian S60 3rd edition smartphones. This mobile phone software platform is composed of a broad range of applications and libraries, which include telephony, delivering fully-integrated functionalities to mobile handsets now commonly referred to as smartphones.

The Symbian S60 3rd Edition is the leading platform for mobile handsets today and supports a wide array of application development in C++, Adobe Flash, Python, and Java MIDP. One of the most important characteristic of S60 smartphones is that users can install new applications.

The V Phone uses the Internet connectivity to route your calls and SMS. This basically means that users can access these services using the Internet through their service providers free of charge as these come out as simple data packets. You are always assured of dedicated and continued access to voice call and SMS service offered at low rates via 3G and WiFi.

The V Phone gives you full access to Internet-based international calls using your mobile handsets even if you don't have a current Internet connection as the V Phone has the capability of automatically routing your call to the Internet. The V Phone is the best mobile telephony option for those who are always on the road and have the particular need for a best-value voice call and SMS services to maintain contact with people in practically anywhere in the world and calling home while abroad.

The differential advantage of V Phone over the other VoIP software is that it is not locked to a specific provider and users have the option to select and add the VoIP provider of their choice for voice calls and SMS services. The Codecs supported by V Phone include G711, G729, ULAW, ALAW, GSM, iLBC, and Speex.

The V Phone offers users a maximum of 3 settings of VoIP providers for the SMS functionality on top of the 2 software-defined providers – Clickatell and Pennytel and one user-designated VoIP provider.

If only for the significant savings that you get in using the V Phone, users are logically better off using this mobile telephony service. I have been saving a lot since I started using my V Phone. This was particularly my best answer to the problem that I had with my 2 teenage daughters who are pretty pre-occupied with their SMS messages and texting on a daily basis. To give you a rough estimate at how much I was able to save in my phone bills since I started using my V Phone, consider this:

My children send on the average 20 SMS daily and based on the SMS rate charged by my service provider, I am already spending \$4 a day just for the texting of my daughters. This is equivalent to \$120 a month and this is about the amount that I saved on the SMS cost from the texting of my daughters. If you care to add the cost of for my personal voice calls and SMS, then you will have a general idea how much I am saving now on my phone bills since I switched to V Phone.

Resource Box:

Learn more about the great features and functionality of V Phone and see for yourself all the reasons why it is your better option for your mobile Voice over IP service. For more details about the [V Phone](#) you can visit the [Matrix](#) website.
